5G as enabler of smarter, more connected transportation systems

Bobby Napiltonia, chief revenue officer of NEXT Trucking, examines 5G through the perspective of an end user, in this case a specialist in drayage—the supply chain link between port facilities and other multi-modal transit facilities.

Napiltonia discusses the traction 5G is seeing in the smart ports segments, and also considers how other links in the supply chain—manufacturing, logistics/warehousing and retail can drive ecosystem development through coordinated adoption of next-generation networking.
